DRX9000-SL®

NEXT-GENERATION SPINAL DECOMPRESSION

ADVANCED ENGINEERING | PRECISION-CONTROLLED TECHNOLOGY | BACKED BY CLINICAL RESEARCH

The Next Level in Spinal Decompression

The DRX9000-SL represents a **state-of-the-art** approach to non-surgical spinal decompression, combining **innovative engineering, cutting-edge computerized precision**, and **advanced treatment customization.**

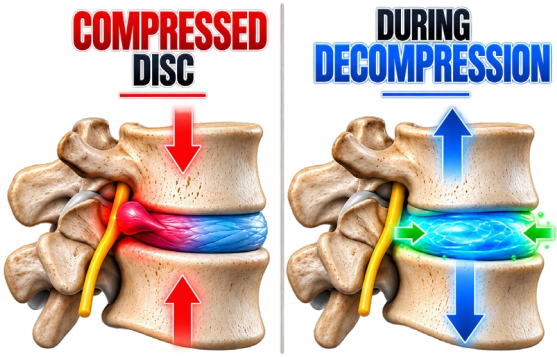

Whether you're trying to avoid spinal surgery, tried other treatments that have failed, or you're an active individual seeking every possible advantage in spinal health and performance, the DRX9000-SL represents the **next level of spinal decompression technology** for those who demand the **very best in spinal care**.

How Spinal Decompression Works

Your spinal discs act as cushions between the vertebrae, absorbing forces and allowing proper movement. With aging or injury, discs can become damaged, leading to pain, inflammation, abnormal spinal mechanics, and pinched nerves.

Non-surgical spinal decompression uses precisely controlled forces to gently pull the spine apart, reducing mechanical stress on the joints, discs, and nerves.

During the treatment, the vertebrae gently separate, reducing intradiscal pressure to help draw bulging or herniated disc material back toward its normal position. This process also promotes natural healing and help to slow the degenerative process.

The ultimate goal is to relieve pain, improve spinal function, and help our patients return to a more active lifestyle.

Who Can Benefit From Spinal Decompression?

We have seen great results with patients who have the following symptoms and conditions:

- Low Back Pain
- Neck Pain
- Sciatica
- Numbness or tingling
- Bulging or Herniated Discs
- Degenerative Disc Disease
- Degenerative Joint Disease
- Spinal Stenosis
- Worn Spinal Joints
- Radicular pain
- Joint pain
- Discogenic Pain
- Weakness in Arms or Legs
- Post Surgical Pain

What Makes The DRX900-SL Different?

REAL-TIME RESPONSIVE TECHNOLOGY

A highly responsive motor system makes up to **100 compensations per second**, continuously responding in real time to patient biofeedback to deliver smooth, controlled spinal decompression forces.

ADVANCED MULTI-LEVEL DISC TARGETING

The DRX9000-SL can automatically adjust its angle of pull during treatment to precisely target one or multiple specific spinal disc levels, delivering an exceptional level of precision and treatment customization.

PATENTED SL TREATMENT CURVE

This innovative Sigmoid Logarithmic design applies a smooth, wave-like pull, designed to minimize muscle guarding and provide a more comfortable, relaxing, and effective treatment experience.

PERSONALIZED PATIENT MEMORY

The DRX9000-SL automatically remembers each patient's individual treatment settings, including positioning and angle of pull, ensuring consistent, customized care and a seamless experience from one visit to the next.

Backed By Clinical Research

90.5%

REPORTED PAIN IMPROVEMENT

A 2025 study involving 267 patients found that **90.5% of those with documented pain outcomes experienced relief**, with average pain scores dropping a remarkable 64%.

77%

MRI-DOCUMENTED REDUCTION

USF Health's Department of Neurosurgery, Brain and Spine uses DRX9000-SL technology for patient care and research. In a 2025 study, **77% of 13 patients showed reduced disc herniation** on follow-up MRI.

What to Expect During Treatment

Comfortable & Non-Invasive: Relax on the DRX9000-SL and remain fully clothed. You typically feel a mild stretching but no pain.

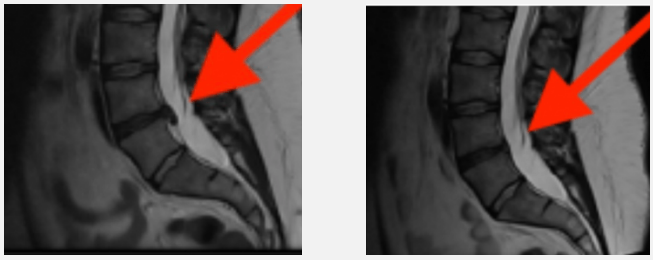

Session Duration: Approximately 20-25 minutes each time. Many people don't want to get off.

Treatment Schedule: Typically 24 sessions over 6-12 weeks, depending on individual needs.

Actual Patient MRI Example

L4/L5 Disc herniation

BEFORE TREATMENT | **AFTER TREATMENT**

MRI images from a published DRX9000 case report demonstrating an incredible reduction in a lumbar disc herniation following 6 weeks of treatment.

Your Spine Deserves More Than Ordinary Care.
